Agrobiodiversity, Community Participation and Landscapes in Agroecology Tomás Enrique León-Sicard ,Diego Griffon,Massimo De Marchi,2024-08-20 Maintaining and managing agrobiodiversity is a key issue proposed by agroecology not only to maintain high agricultural productivity but also to increase the resilience stability and sustainability of the agroecosystems meant as the functional relationship between the natural assets and the human use of them at farm and farm matrix scale The main hypothesis of this approach is that the greater the interactions between organisms of different trophic levels edaphic organisms multiple crops weed plants herbivores carnivores plants in living fences corridors or forest patches within agroecosystems the greater will be the possibilities of obtaining abundant and varied harvests with fewer external inputs pesticides fertilizers and better environmental performance The agrobiodiversity is meant as the variety and the disposition of the cultivations pastures farms that affect the soil properties and create habitat diversity landscape diversity and connectivity At the level of landscapes or territories the set of biodiverse agroecosystems generate natural matrices that have a powerful impact on the recovery and restoration of forest corridors which in turn positively influence many ecosystem services for nature conservation and free movement and recovery of many populations of animal species including those in danger of extinction

have created a need for innovative agricultural practices to effectively manage soil borne pathogens While traditional soil fumigation has been commonly used alternative practices like soil bio fumigation biosolarization and anaerobic soil disinfestation ASD have gained popularity due to their potential sustainability benefits However these techniques often rely on impermeable plastic barriers which can be a drawback from a sustainability standpoint Promisingly there are technologies emerging that focus on shifting soil microbial communities to naturally suppress soil borne pathogens and diseases By leveraging these microbial communities we may indirectly enhance soil health and promote a circular economy particularly when incorporating organic amendments originating from agricultural and food byproduct bioconversion technologies This research topic seeks high quality articles and reviews that illuminate the interactions between soil organic amendments and pathogens in both the short and long term We aim to gain a better understanding of the mechanisms at play in controlling soil borne pathogens including the resilience of microbial communities the role of plant resistance and the overall effects on soil health and crop yields Practical Skills in Environmental Science Allan Jones,2000 This work provides students with easy to read guidance on fieldwork sampling laboratory studies project work and computing and communication skills Text is supported by numerous illustrations and tables and there is coverage of the necessary information technology
