Diagram 1.1: Normal Heart

### Functioning of the Heart

The heart has three major types of cardiac muscle namely the **atrial**, **ventricular** and the **specialized excitatory and conductive muscles**. The heart muscle is organized in two syncytium with the many cells connected in series with intercalated discs with specialized structures such as **fascia adherens** (mechanical links), **mascula adherens /desmosome** (lattice structure and site for cytoplasmic filaments) and **gap junction** (makes the adjacent cells loose and is permeable to ions). This arrangement facilitates the all or nothing principle.

### The Cardiac Cycle

The cardiac cycle comprises of

- **Phase I – Atrial Contraction** - period of rapid refilling of ventricles in the first  $\frac{1}{3}$  of diastole, blood moves slowly into the ventricles in the middle of  $\frac{1}{3}$  of diastole and atrial contraction pushes more blood into the ventricles (20 – 30% of ventricular refilling) in the last  $\frac{1}{3}$  of diastole.
- **Phase II – isovolumic ventricular (isometric) contraction** - emptying ventricles during the beginning of ventricular contraction when no emptying takes place hence the name isovolumic or isometric (i.e. is there is no increase in tension of muscle but no shortening of muscle fibres)
- **Phase III – ventricular systole** – period of ejection with ventricular systole when there is fast and slow ejection of blood. Left ventricular pressure rises slightly above 80 mmHg and right ventricular pressure rises slightly above 8 mmHg forcing open the mitral and tricuspid valves respectively; this is fast ejection that accounts for 70% of ventricular emptying. There is the period of slow ejection that lasts the last  $\frac{2}{3}$  of systole.
